THE 3 STEPS.

Your video gives the movement. One edited frame gives the look. Genjutsu puts them together.

1. Film yourself

Act the moment you want your character to perform, in a clip of 4 to 30 seconds. Keep the camera still and the framing the same for the whole take.

2. Make the character image

Save one clear frame from your video; a screenshot works. In an image editor, turn yourself into your character and keep the same camera angle, framing and room. For example: **“Turn the person into a lion. Keep the same camera angle, framing, background, props and lighting.”**

3. Add both to Genjutsu

In Higgsfield, open Genjutsu and choose **Object Swap**. Add your original video and the edited image, then press **Generate**. A short description is optional. The app shows the credit cost before you run it.

Results vary. My lion followed my movement; my rooster didn't. A body very different from yours can make it harder.

The paid guide adds how I made the character image, settings, ten fixes, real examples, how to move your character to a new world, and copy-paste prompts.

Higgsfield access and generation costs are separate. Higgsfield's own page explains the tool for free.
